Online Appendix

Figure A: Coefficient plot for the subgroup of respondents living in municipalities with at least 100,000 inhabitants

Standardized linear regression estimates with 95% confidence intervals from separate models based on cluster-robust standard errors (municipality level) and multiple imputed data; N = 5680; all models control for age, gender, education, unemployment, home ownership, region of Germany, number of inhabitants and immigrants as well as the mean flat size in the neighborhood

Figure B: Coefficient plot for six other ethnic halo constellations operationalized at different sizes

Standardized linear regression estimates with 95% confidence intervals from separate models based on cluster-robust standard errors (municipality level) and multiple imputed data; N = 5680; all models control for age, gender, education, unemployment, home ownership, region of Germany, level of urbanity, number of inhabitants and immigrants as well as the mean flat size in the neighborhood

Figure C: Coefficient plot for bivariate associations between social integration and contentious constellations of ethnic diversity

Standardized linear regression estimates with 95% confidence intervals from separate models based on cluster-robust standard errors (municipality level) and multiple imputed data; N = 5680; all models control for age, gender, education, unemployment, home ownership, region of Germany, level of urbanity, number of inhabitants and immigrants as well as the mean flat size in the neighborhood

Figure D: Coefficient plot for estimates without contextual factors

Standardized linear regression estimates with 95% confidence intervals from separate models based on cluster-robust standard errors (municipality level) and multiple imputed data; N = 5680; all models control for age, gender, education, unemployment, and home ownership
